

# ISG™ On Demand Healthcare Labels

## Print Labels & Wristbands As Needed

### Print Personalized Labels Whenever & Wherever

Until now, healthcare professionals only had two options for printing patient labels - use costly sheets of labels and replace toner often - or use thermal printers. Both of these solutions require a static work-station, taking them away from the patient's side costing time and efficiency.

Now there is a third option - print "on demand" wristbands and labels immediately using the ISG™ S500 Thermal Printer - or any of our Summit Series Printers - right at a patient's side, nurse's station, or wireless cart. Using any 2D scanner plugged directly into the low profile S500, scan the 2D barcode on the patient's wristband or chart label - out will immediately print the exact same information as what you just scanned!

This eliminates the need to physically log onto your ADT or HIS, get into the patient information, use the correct key strokes or find the right place to print and then print a whole page of labels. In your fast paced Healthcare environment you need to be able to get one or two labels on demand fast. Since the labels are printed as soon as the patient's wristband is scanned and can include a time/date/location stamp, your time and efficiency are greatly improved.

The dependable, fast S500 uses our proven PAL (Printer Application Language) programming along with other popular emulations which easily enables users to interpret, translate, filter, add-to and format almost any data stream sent from any host running any application. This means that development costs and installation costs are eliminated since the printer integrates seamlessly with not only current scanners but also with existing network systems. So expense, time, and patient safety can all be improved using this unique, dynamic solution!
