Identify, Manage & Track Visitors

Consider replacing your existing paper log book with an electronic visitor management system for increased security and accountability in your hospital. Easily enroll visitors, volunteers and other guests in less than 6 seconds. Simply scan a Driver's License, choose a purpose for the visit and automatically print a customized visitor badge. With Visitor Manager, you will always have an accurate list of who is currently onsite and data about those who have visited before.

Badge Hospital Staff & Volunteers

Identifying hospital employees is critical to the security of your facility. Consider implementing a Photo ID system that offers you the flexibility to design your own unique, high quality badges, enroll users and capture photos easily. By wearing ID badges at all times, you can easily identify those who belong in the building and those who do not.

Control Access to Secure Areas

Wouldn't it be nice to have an audit trail of who has entered specific doors in the hospital; especially those in highly secure areas? Electronic card access systems can be implemented as an alternative means of controlled access throughout the campus, allowing you to grant and restrict access to secure areas in the facility and run reports on who has accessed each door and when.

Enroll Patients Faster

The speed and accuracy of patient enrollment is critical to any hospital. SmartReg allows for fast and accurate recall of the correct person's record upon ID scan or automatic enrollment of new patients by reading the electronic information from the ID card. Any information available on the Driver's License or government issued ID can be populated into your patient enrollment screen. Save time, money and reduce duplicate medical records caused by errors, typos and common names.
