

Mobile Biometric Authentication

For Secure Application Access

Strengthen trust and security for your enterprise and client applications using biometric multi-factor authentication.

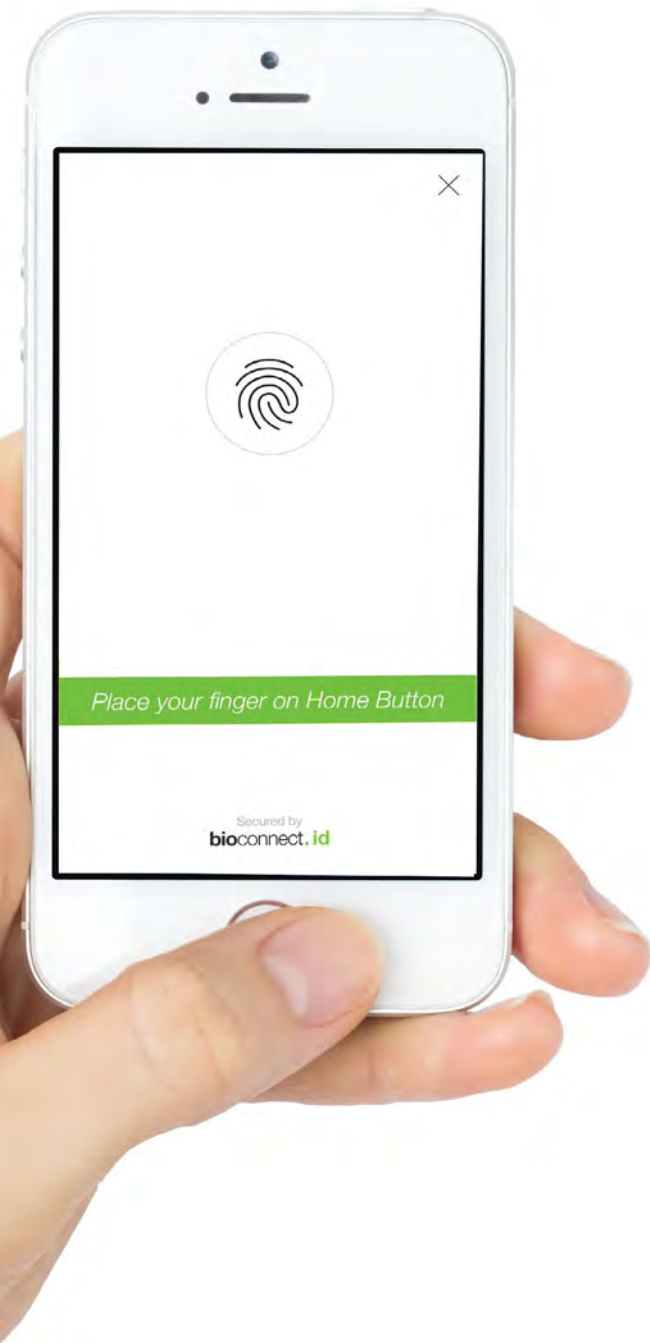

Mobile Biometric Authentication

Whether it's for internal networks or client security, mobile biometrics can provide organizations with exact identity assurance of who is accessing secure applications or approving high-risk transactions.

With the BioConnect Mobile Authentication App, your enterprise can send risk-based step-up requests complete with a full audit log of all transactions and access attempts of users provided, creating a layered defense against unauthorized or suspicious access.

Security for Applications

Biometric access control can be implemented at any level of the enterprise. With BioConnect's solution for mobile applications, you can easily secure your enterprise network across the entire organization. Users will not be able to indulge in password sharing - a practice that is one of the leading causes for compromising enterprise security. Each biometric identity is associated with a device so users must be present and engaged in all access attempts and can no longer pass along authorization to secure data.

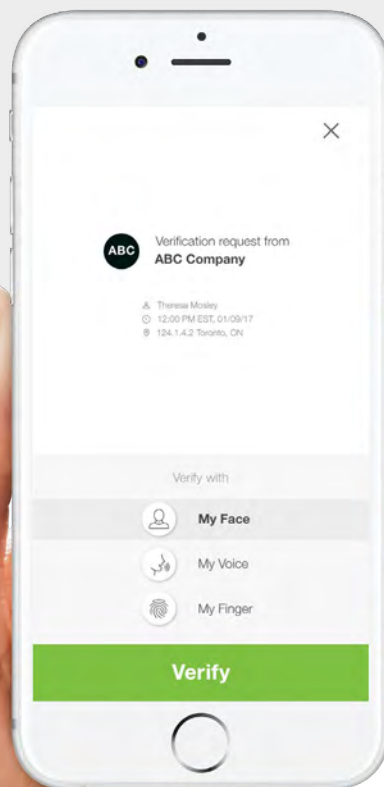

How it Works

The BioConnect approach to deploying mobile biometric authentication in the enterprise is comprised of two technological components:

- 1 For users:** BioConnect's mobile biometric authenticator app or SDK. Available across iOS & Android smartphones for a user's biometric registration as well as secure authentication. A simple but highly secure DIY enrollment process ensures complete privacy, security and reliability of the biometric data.
- 2 For administrators:** Admin Console is an easy to use reporting dashboard that collects real-time data about employee access events.
- 3 For Enterprise:** Our Open-API based BCID Server gives an enterprise the flexibility to build its own reporting and support structures for seamless management of the mobile biometric authentication platform.

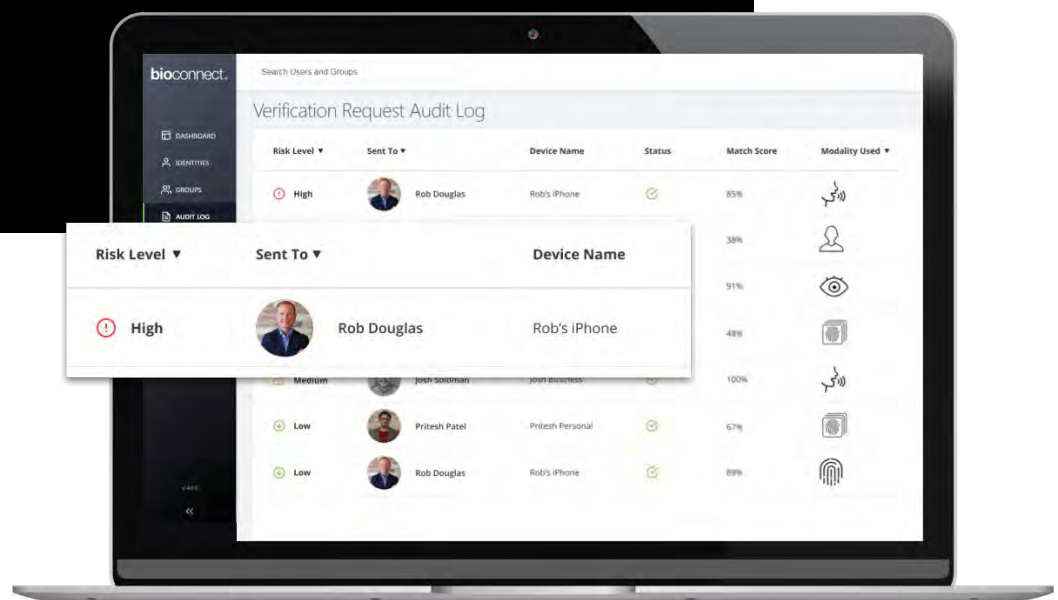

Mobile Biometric Authenticator

Allows for step-up biometric authentication that is easy and convenient for the user. Whether downloading sensitive files, connecting to a VPN, or completing high-risk business transactions, trusted connections require knowing who is on the other side. The mobile app allows for single or multifactor authentication while offering immediate detection of malicious activity, geographic and time anomalies, and provides actionable incident management.

Admin Console

The Admin Console provides a comprehensive enterprise-wide view of the users and digital access events making user and device management simple and user-friendly. The Console provides valuable insights into the usage pattern, while also giving administrators control over user and device life cycle management. The authentication methods can be customized at an account level, user or even device level at a click of a button. An extensive audit log helps in reviewing for any unusual activity and making informed decisions for improving security protocols.
